

The Report of Lake Bunyonyi Leprosy Settlement for 1954

mentions:

“ Medical safaris in outlying parts of the district show that leprosy continues on the decline in Kigezi. Ankole patients, who speak the same language as that of Kigezi, are continuing to seek admission for treatment. These cases are in a very poor condition indeed nutritionally, and in an advanced state of the lepromatous disease. The condition of these cases suggests that there is a considerable incidence of leprosy in certain counties of Ankole.”
